

Modernize your network with Citrix App Delivery and Security and Google Cloud

Citrix and Google help your IT organization optimize the app experience across multi-cloud environments.

Here's how

Managing your multi-cloud environments

Your applications may be deployed via on-premises servers, Google Cloud, or a combination of both. Citrix App Delivery and Security solutions manage your app access and performance to help you deliver a seamless, highly available, and responsive experience for users that enables them to take control of their workday and do their best work. These solutions also centralize automation, management, security, and analytics for hybrid network deployments.

Moving on-premises and legacy workloads to the cloud

As IT moves more apps and data to Google Cloud, Citrix App Delivery and Security solutions provides a common platform that simplifies the transition. Use our single code base to support all the different form factors you need, from hardware to software, creating operational consistency. Gain holistic observability by using Citrix to centralize management of all your workloads across the hybrid cloud.

Delivering cloud-native networking for microservices and container apps

Applications are increasingly segmented into microservices and containers, meaning access, uptime, and performance levels become more complex for your DevOps and platform teams to manage. The management and load-balancing capabilities in Citrix ADC can be used with microservices and Kubernetes in Google Cloud, helping you flexibly support future growth.

Improving performance for remote access to cloud resources

Workers at remote sites, including branch offices, expect the same level of application performance as headquarters employees enjoy. Citrix App Delivery and Security enables organizations to dynamically provision services from Google Cloud to reflect current network conditions and ensure a consistent, high-performance app experience.

Delivering integrated user access

An integrated access gateway offers a single URL for a user to remotely access any app on any device with single sign-on. Your IT team benefits with simple, centralized management of access policies.

Why Google Cloud and Citrix are right for you:

Zero-trust security protects your data from the cloud to the device.

Hybrid and multi-cloud integration with Anthos gives you choice and flexibility.

Embedded AI and ML brings intelligence to your business without a fleet of data scientists.

Fully managed NoOps automates manual tasks and configurations.
